

IRRICAD 13

IRRICAD's latest upgrade is here!

- Multi-step Undo and Redo
- Single file saving for easy design sharing
- Improved flushing calculations and reports
- New design process workflow
- New Geo-Tiff and GIS import tools
- Tree block tool
- Polygon seed tool
- Show area tool

IRRICAD 13: What's new

IRRICAD Pro 13 is the latest major release of IRRICAD the leading irrigation design platform. We've worked hard to bring you a range of new functionality and user experience improvements.

Also, a reminder that when you purchase IRRICAD Pro 13 you will continue to receive free priority support and patch releases for 12 months as well as 2 hours of one-to-one online training to help you make the most of the new features (conditions apply).

MULTI-STEP UNDO AND REDO

- If you have mistakenly performed an action you can reverse these actions - right back to when the design was last opened.
- IRRICAD Undo retains all addition, deletion and modification actions for drawing and hydraulic entities.

SINGLE FILE SAVING

- IRRICAD designs are now contained in a single *.dez file. This is a ZIP compressed archive which is automatically uncompressed when a design is opened. The new file format makes sharing and file management much easier.

IMPROVED FLUSHING CALCULATIONS & REPORTS

IRRICAD now uses valve pressure to calculate and report what is actually happening under these conditions

- **Zone flushing report:** Extensive hydraulic reporting for tapes under flushing, based on valve pressure
- **Flush ID Keyword for labelling plan:** Provides a graphical display of manifold numbering.

NEW DESIGN PROCESS WORKFLOW

- Zone design is now completed before the Management process to better align with traditional design workflow and ensure actual flows are used in the Management process.

TREE BLOCK TOOL

- Rapid tree block layout with auto-spacing and tree counts.

GEO-TIFF IMPORTING & GIS IMPORT OPTIONS

- Geo-Tiff images are able to be imported directly, correctly scaled, to their world coordinates.

ALSO INCLUDED

- **Polygon seed tool** allows you to easily create a single object from regions defined by multiple objects.
- **Show area tool** quickly displays the internal area of regions defined by multiple objects.
- **Current drawing properties toolbar** for quick editing.
- **Second label set** allows you to display, and toggle between, two separate sets of label properties on your design.
- **New label keywords** including listing fittings and subcomponents as an easy reference for installation.

MORE INFORMATION

You can read more on changes and new features in Version 13 in the [Recent Developments](#) on our website.
